FLIPPY AI

Designing a smarter shopping experience for Flipkart

UI/UX CASE STUDY • Conversational AI • Product discovery • Decision support

A proposed AI shopping assistant that helps customers compare products, discover relevant alternatives, and make more confident purchase decisions.

ROLE	PLATFORM	FOCUS
UI/UX & Product Design	Responsive e-commerce	Smartphone shopping

01 / Project overview

Flipkart provides product listings, ratings, specifications, filters, and offers. Yet shoppers comparing high-consideration purchases such as smartphones may still need to visit multiple pages, interpret technical details, and reconcile reviews with discounts.

The opportunity

Introduce Flippy AI: a contextual shopping assistant that understands user priorities, explains product trade-offs, and helps shoppers move from broad discovery to a confident shortlist.

Problem statement

How might we help customers discover, compare, and choose the right smartphone through an AI assistant that gives relevant, understandable, and transparent recommendations?

Core pain points

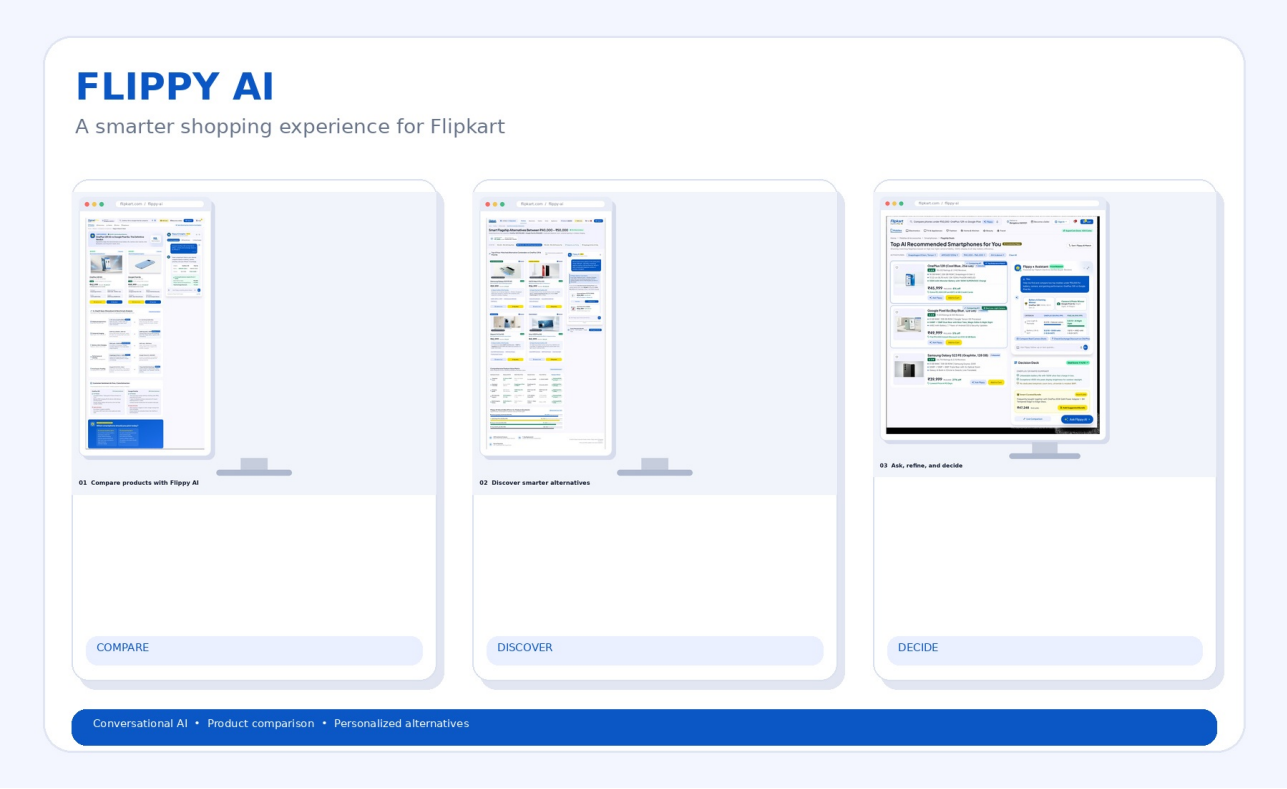

PAIN POINT	WHAT THE USER EXPERIENCES	DESIGN OPPORTUNITY
Complex comparison	Specifications and reviews are spread across multiple pages.	Summarize differences in one view.
Choice overload	Many products look similar, with unclear trade-offs.	Personalize by needs and budget.
Unclear value	Discounts and exchange estimates can be confusing.	Show a transparent price breakdown.
Research fatigue	Customers switch between listings, reviews, and videos.	Answer follow-up questions in context.

Project scope

- Primary use case: comparing smartphones in a defined budget.
- Design scope: product comparison, AI-powered alternatives, and persistent conversational assistance.
- Design status: proposed concept based on the supplied UI screens; research and performance metrics are not yet validated.

02 / Feature concept

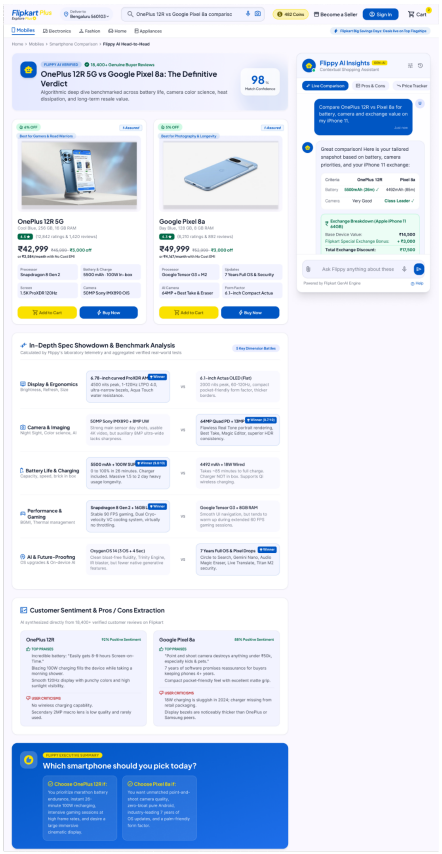

Flippy AI should behave like a shopping guide—not a generic chatbot. It uses the customer's stated requirements to organize product information, explain why a recommendation fits, and keep the next action clear.

FEATURE PILLAR	DESIGN BEHAVIOR	USER VALUE
Conversational shopping	Accept everyday-language requests and clarify only when needed.	Less reliance on complex filters.
Smart comparison	Highlight meaningful differences based on selected priorities.	Faster understanding.
Alternative discovery	Suggest budget-matched options with explicit trade-offs.	More relevant choices.
Trust & transparency	Separate verified facts, review themes, estimates, and AI conclusions.	Better-informed decisions.

03 / Screen 1 — Product comparison hub

Help users compare shortlisted phones without repeatedly switching product pages.

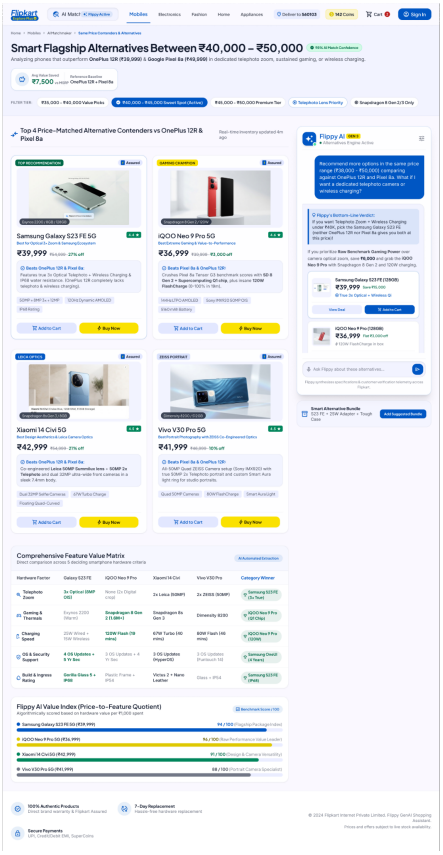

Key UI elements

- AI comparison summary and a quick explanation of the verdict.
- Product cards with price, ratings, offers, and core specifications.
- Side-by-side analysis of display, camera, battery, performance, and software support.
- Customer sentiment summaries and contextual follow-up chat.
- Decision summary tailored to gaming, photography, battery, or long-term use.

Design note: Keep the AI verdict explainable. Clearly distinguish sourced specifications from generated summaries, and let users inspect the underlying evidence.

04 / Screen 2 — Smart alternatives

Help users discover better-fitting phones when the original shortlist is over budget or misses an important feature.

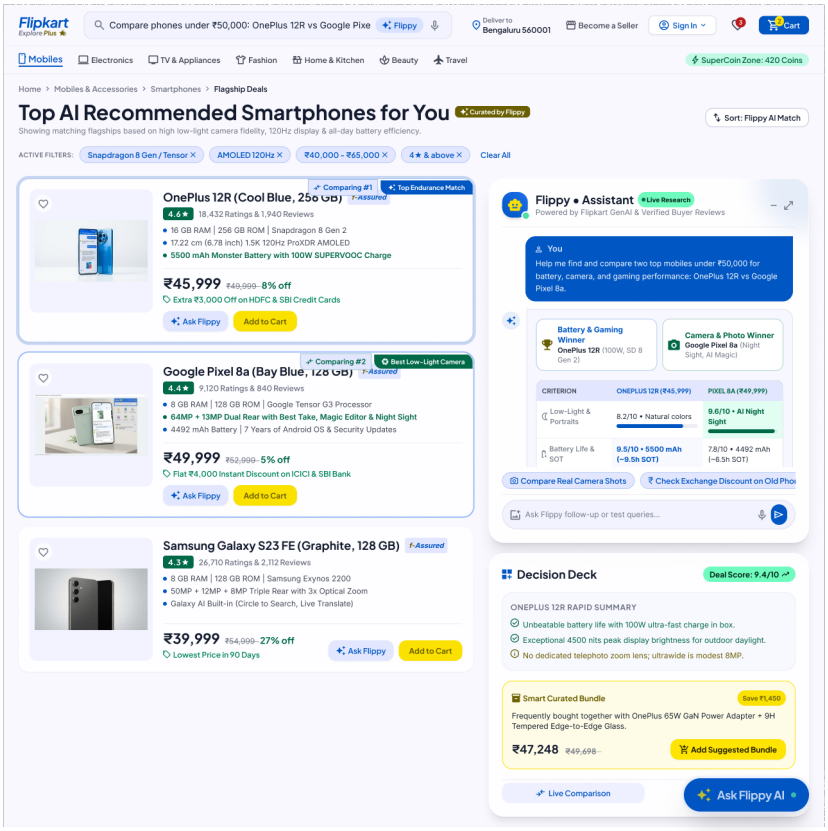

Key UI elements

- Budget bands and quick filters for priority features.
- Alternative cards that explain what each option improves and sacrifices.
- Feature-value matrix for hardware, charging, software support, and durability.
- Refinements such as better zoom, faster charging, or wireless charging.
- Optional accessory bundles with transparent pricing

Design note: Avoid opaque value scores. Explain the scoring criteria, let shoppers adjust priorities, and show when data is unavailable or estimated.

05 / Screen 3 — Conversational assistant

Make Flippy available throughout the shopping journey so users can ask questions in natural language.

Key UI elements

- Understand budget, use case, and must-have features.
- Retrieve matching products and current listing information.
- Summarize trade-offs in plain language.
- Support follow-up questions without losing the current shortlist.
- Link directly to product details, comparison, and purchase actions.

Design note: Keep responses concise, provide suggested prompts, and always allow users to correct the assistant or continue with regular search and filters.

06 / User journey & flow

The assistant should preserve shopping context at every step. A user should not need to repeat requirements when moving from discovery to comparison or alternatives.

STEP	USER ACTION	FLIPPY AI RESPONSE
01 · Discover	Search or open Ask Flippy AI.	Offers a clear starting point.
02 · Describe	Share budget, usage, and priorities.	Interprets intent; asks only useful clarifying questions.
03 · Compare	Review the shortlist.	Highlights meaningful differences and evidence.
04 · Refine	Ask for alternatives or change priorities.	Updates results while retaining context.
05 · Decide	Review final price and product details.	Separates guaranteed discounts from conditional offers.
06 · Purchase	Add to cart or checkout.	Hands off to existing Flipkart purchase flow.

Example conversation

Customer: “I need a phone under ₹50,000 for gaming, battery life, and occasional photography.”

Flippy AI: “I’ll prioritize sustained gaming performance and battery life, then compare camera quality. Do you prefer a compact phone or a larger display?”

This is a proposed interaction example, not a transcript from a live product.

07 / Visual design system

The proposed interface retains familiar Flipkart visual cues while giving the AI assistant a recognizable, consistent identity.

Typography & components

- Typography: Inter or a similar readable sans-serif; strong hierarchy for headings and product names.
- Components: product cards, comparison tables, chat bubbles, prompt chips, recommendation labels, and price breakdowns.
- Actions: maintain clear visual distinction between primary purchase actions and secondary AI actions.
- Accessibility: adequate contrast, keyboard focus states, responsive layouts, and text alternatives for meaningful icons.

AI trust & edge cases

RISK	DESIGN RESPONSE
Incorrect specifications	Use structured product data and display source or last-updated information.
Outdated pricing	Revalidate price and offer eligibility before purchase.
Misleading review summary	Show recurring themes and link to original reviews.
Biased ranking	Explain criteria and allow priority adjustments.
Unknown information	Say when a detail cannot be verified rather than inventing an answer.

08 / Usability testing plan

Proposed first round: 5–8 moderated sessions with smartphone shoppers. Use the findings to refine the concept before running a larger quantitative experiment.

- Task 1 — Find a phone: complete a budget-based search and explain why the selected phone fits.
- Task 2 — Compare: identify which shortlisted phone better meets a stated camera, battery, or gaming need.
- Task 3 — Refine: request a cheaper alternative and change one priority without restarting.
- Task 4 — Verify price: distinguish final price, bank offer, and estimated exchange value.

Measure task completion, time to shortlist, comparison accuracy, confidence, recommendation relevance, and price comprehension.

09 / Success metrics

The metrics below are illustrative targets for planning—not measured results or promises of impact.

METRIC	ILLUSTRATIVE TARGET / METHOD
Comparison completion	Target: +15% versus baseline; validate with a controlled experiment.
Time to shortlist	Target: 20% reduction versus baseline; measure from task start to shortlist.
Purchase conversion	Measure completed purchases among eligible users; monitor returns and cancellations too.
Recommendation quality	Track relevance ratings, corrections, alternative selections, and user confidence.
AI reliability	Monitor factual errors, unsupported claims, latency, and fallback/escalation rate.

Validation approach

- Compare the existing experience with the AI-assisted flow through an A/B test.
- Measure primary outcomes alongside trust and accuracy guardrails.
- Do not treat chatbot engagement alone as proof of a better shopping experience.

10 / Future scope

- Laptop finder for gaming, design, programming, and study use cases.
- Camera comparison using clearly sourced sample images and limitations.
- Permission-based price-change notifications for shortlisted products.
- Multilingual and voice-based discovery, with accessible response design.
- Post-purchase help for setup, compatibility, warranty, and support.

Conclusion

Flippy AI shifts the shopping experience from simply displaying products toward helping people understand which product best fits their needs. The concept connects conversational discovery, evidence-based comparison, relevant alternatives, and transparent pricing within one familiar journey.

Portfolio title: Flippy AI — Designing a Smarter, More Personalized Shopping Experience for Flipkart.

Important note: The product screens, product prices, ratings, savings, review statistics, and comparison scores in this case study are illustrative UI content from the concept screens. They should be verified against real Flipkart data before being presented as factual results. No user research or business impact is claimed as completed.
