FORGE

FITNESS, FOCUS, AND MOMENTUM.

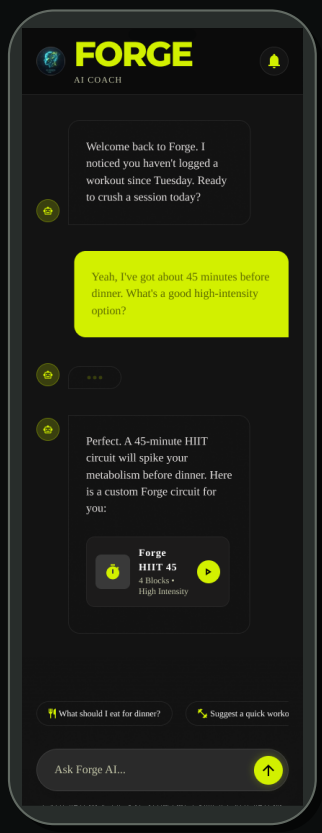

A UX/UI case study for a fitness companion that brings training, nutrition, recovery, and AI coaching into one focused experience.

01 / HOME

02 / DAILY PLAN

03 / AI COACH

CORE IDEA

Make the next healthy action obvious — and easy to start.

CONCEPT DESIGN • MOBILE APP • 2026

01 / OVERVIEW

A personal system, not just a tracker

FORGE connects workout planning, exercise guidance, nutrition logging, and conversational coaching in one dark, high-energy mobile experience.

THE USER CHALLENGE

Fitness apps can fragment the routine: plan in one place, look up form elsewhere, estimate food in another, and lose momentum between tasks.

THE DESIGN OPPORTUNITY

Create one clear loop: decide what to do, understand how to do it, record the effort, then use the result to guide the next session.

PRODUCT PROMISE

Plan it. Train it. Fuel it. Learn from it.

01 PLAN

Daily focus, goals, schedule and weekly output.

02 TRAIN

Workout library, exercise cues, set logging and completion.

03 FUEL

Calories, macros, water intake and meal history.

04 COACH

AI chat for contextual suggestions and habit support.

Design for real training contexts

The interface suggests three recurring user needs. These are working hypotheses for concept design, not findings from formal user interviews.

1

THE BUSY BUILDER

Wants a workout that fits the time available.

Need: fast start, clear duration, no planning overhead.

2

THE LEARNING LIFTER

Wants to improve technique and confidence.

Need: visual muscle targeting, instructions, sets/reps and rest.

3

THE CONSISTENCY SEEKER

Wants to connect effort with nutrition and recovery.

Need: progress cues, simple logging and helpful reminders.

JOBS TO BE DONE

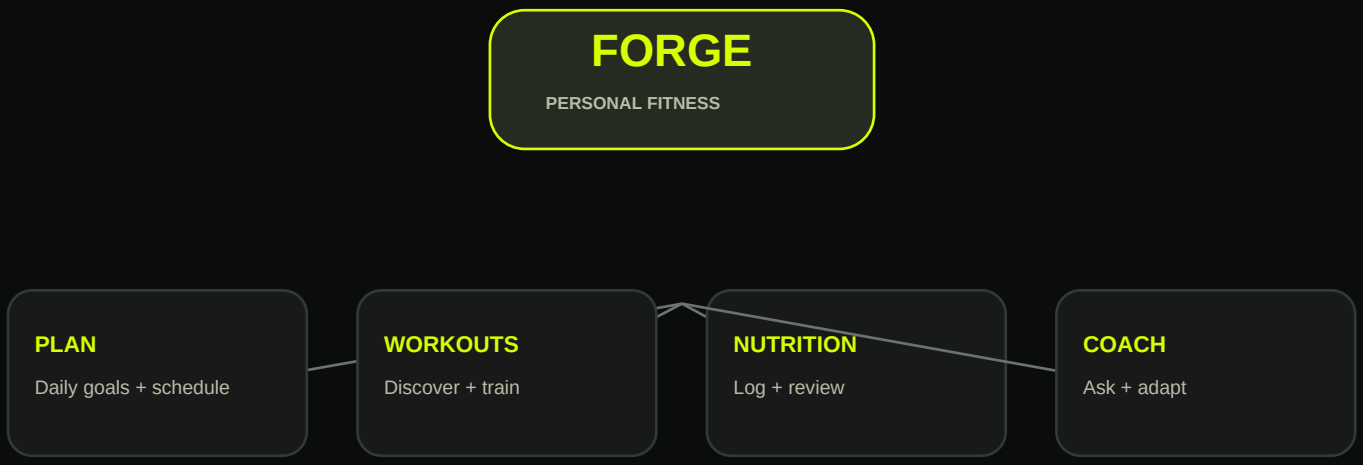

01 “When I have limited time, help me choose a session that feels achievable.”

02 “When I try an exercise, show me what to do and how to track it.”

03 “When I finish, help me understand my effort and what to do next.”

One loop across five destinations

The bottom navigation keeps the major modes predictable, while workout and nutrition screens carry the detail needed to complete a task.

PRIMARY WORKOUT FLOW

01
Browse workout
Filter by strength, HIIT or mobility.

›

02
Open exercise
Review video, targets and instructions.

›

03
Log a set
Enter load and reps; complete the set.

›

04
Review result
See duration, effort and completed exercises.

UX principle: every screen should answer “where am I, what matters now, and what is the next action?”

04 / VISUAL LANGUAGE

High contrast. Clear hierarchy. Energy with res

A near-black canvas makes the neon action color feel purposeful. Cyan and warm pink add secondary meaning without competing with the primary CTA.

FORGE LIME

TYPE HIERARCHY

FORGE / Display

Section title / 16–20 pt

Body copy: calm, readable, conversational.

Labels / 7–9 pt, uppercase, letter-spaced in spirit

COMPONENT PRINCIPLES

Primary CTA

Lime fill, dark text, generous touch target.

Progress

Bars and rings show status at a glance.

Cards

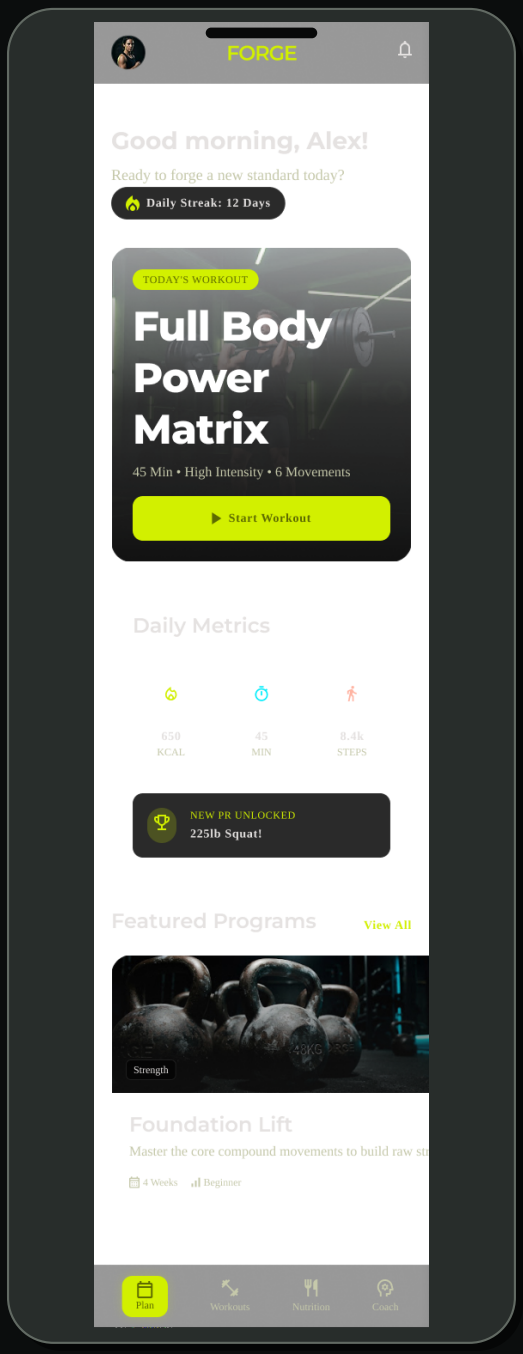

Rounded dark surfaces separate information groups.

Feedback

Completion, streaks and PRs reinforce effort.

The daily plan is the command center

The home screen creates a motivating entry point; the daily dashboard makes goals, nutrition and scheduled movement scannable.

MOCKUP A / HOME

MOCKUP B / DAILY PLAN

WHAT WORKS

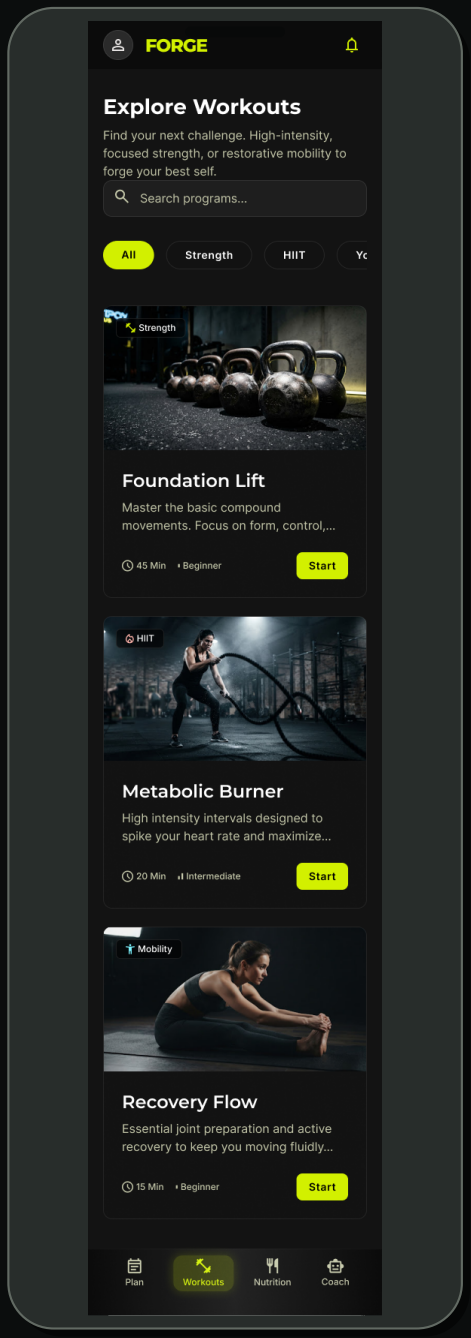

The workout CTA is prominent and progress metrics are grouped.

DESIGN WATCHOUT

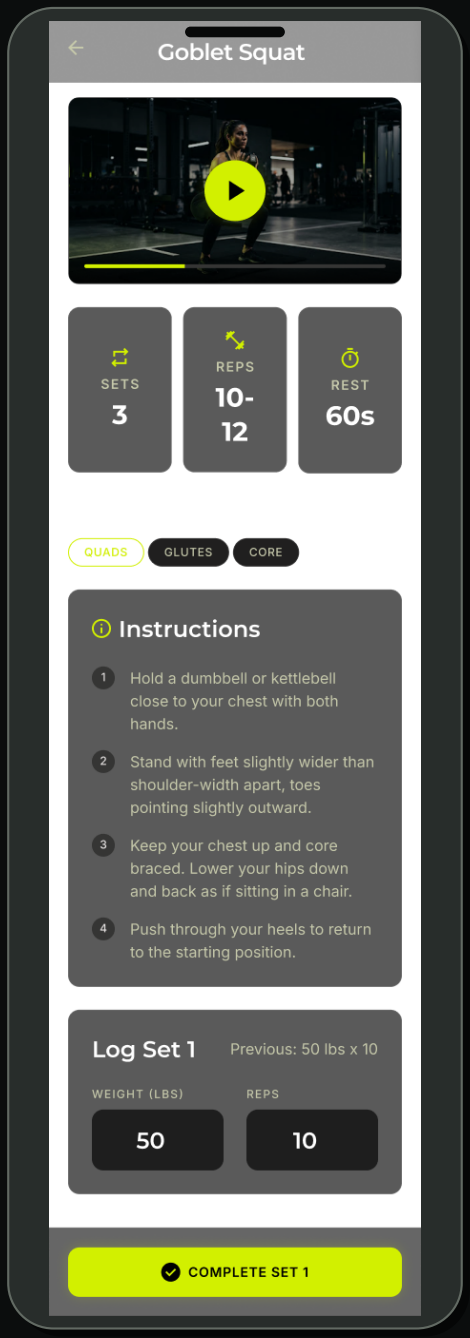

Avoid letting secondary metrics compete with the next action.

From discovery to confident execution

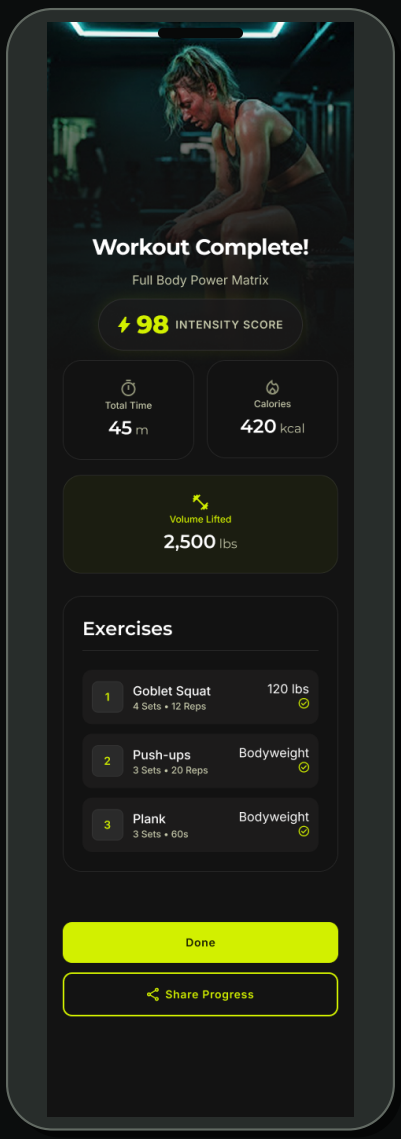

The workout library helps users choose a session; the exercise detail screen reduces uncertainty with clear targets, instruction and logging.

MOCKUP C / WORKOUT LIBRARY

MOCKUP D / EXERCISE DETAIL

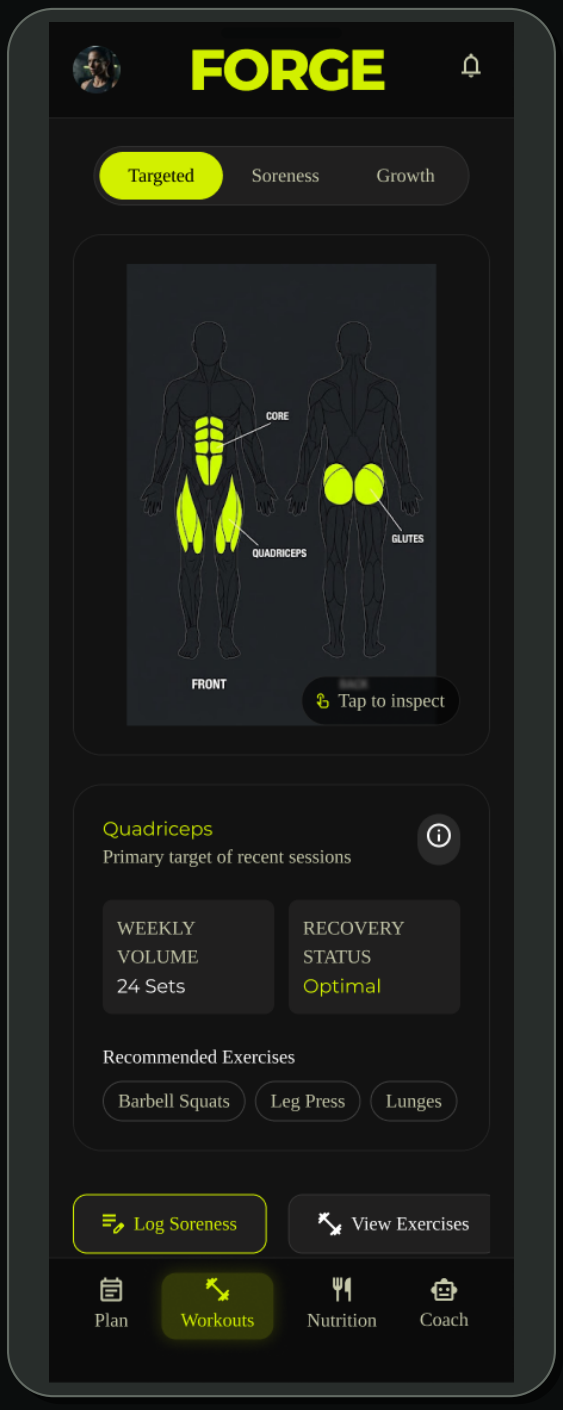

MOCKUP E / SESSION SUMMARY

INTERACTION PATTERN

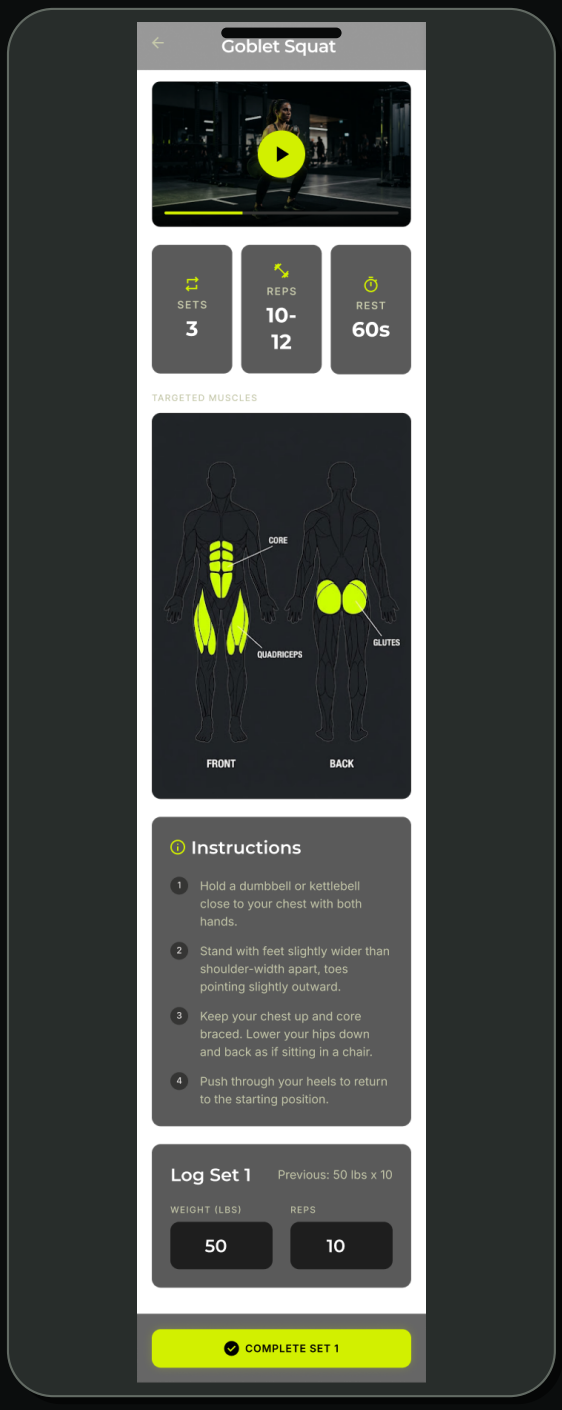

Discover → preview → perform → log → celebrate → return to plan.

Make the body map useful, not decorative

The muscle explorer links a visual body model with a selected target, weekly volume, recovery status and suggested exercises.

MOCKUP F / MUSCLE MAP EXPLORER

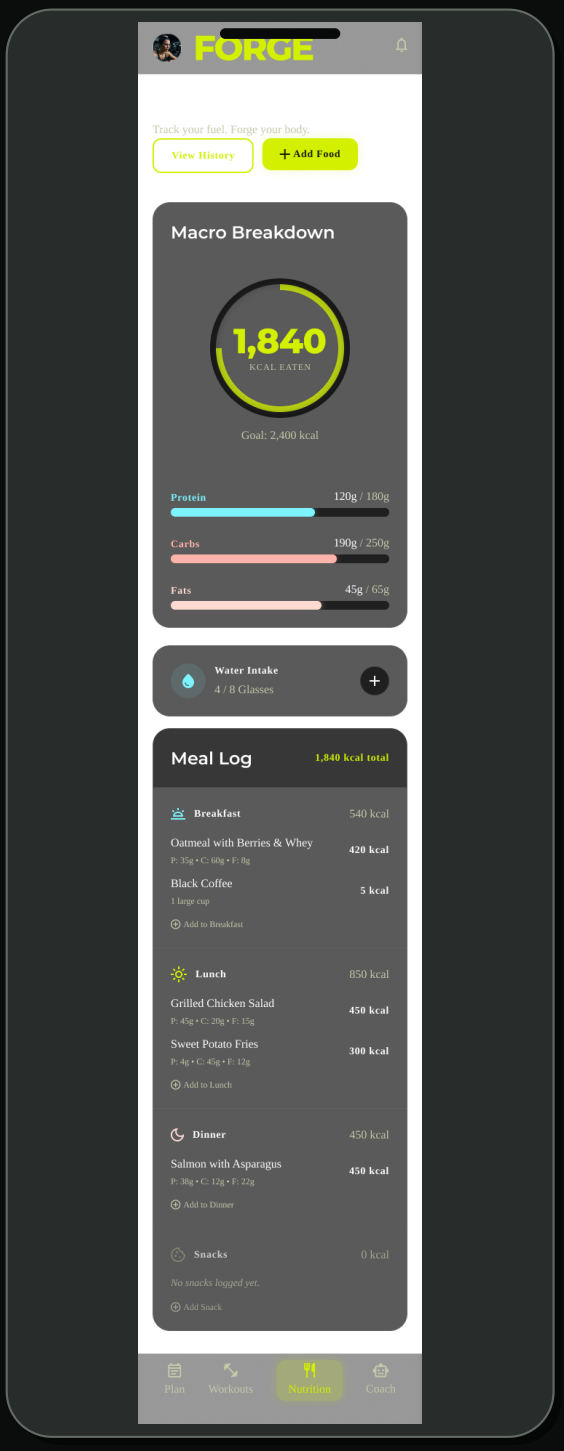

MOCKUP G / TARGETED MUSCLES

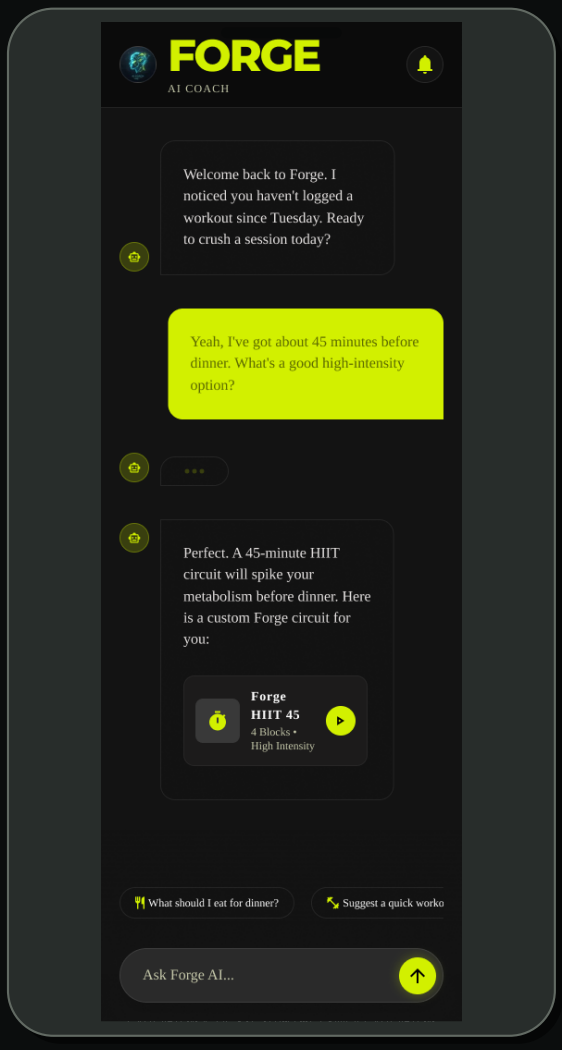

- **VISUAL FEEDBACK**
  Highlight active muscle groups.
- **CONTEXT**
  Show volume and recovery cues.
- **NEXT STEP**
  Recommend relevant exercises.

Support the whole routine

Nutrition logging and AI coaching extend FORGE beyond the workout itself. The best experience is contextual, supportive and transparent.

MOCKUP H / NUTRITION TRACKER

MOCKUP I / AI COACH

COACHING GUARDRAILS

Contextual
Use stated time, goals and recent activity.

Actionable
Offer one or two realistic next steps.

Non-judgmental
Encourage consistency, not perfection.

Safe
Avoid medical claims; encourage expert advice when needed.

What to preserve — what to refine

The screens establish a strong visual identity and broad feature coverage. The next iteration should improve consistency, readability and trust.

01 CONTRAST & READABILITY

Some pale text on light surfaces appears low contrast. Standardize dark/light themes and validate contrast for all states.

02 METRIC CONSISTENCY

Calorie and macro goals differ across screens. Define a single source of truth and consistent units across dashboard and nutrition.

03 NAVIGATION CONTINUITY

Keep bottom navigation consistent in position, style and selected state across every primary screen.

04 AI TRUST

Clearly label AI-generated suggestions, provide rationale when useful, and let users adjust or dismiss recommendations.

05 EXERCISE ACCESSIBILITY

Pair color-coded muscle maps with labels, text descriptions and accessible alternatives; do not rely on color alone.

06 WORKOUT RECOVERY

Allow users to pause, edit a set, skip an exercise or recover from accidental taps without losing progress.

Measure whether the product makes action eas

The following are proposed usability tests and success metrics for a next design iteration — not measured outcomes.

01
DISCOVER
Find a suitable 20–45 minute session.

→

02
UNDERSTAND
Identify target muscles and explain the movement.

→

03
COMPLETE
Log a set and finish a workout.

→

04
REFLECT
Review the session and return to the plan.

PROPOSED USABILITY TASKS

- Start a workout from the daily plan without help.
- Find how to perform a goblet squat and identify its target muscles.
- Log weight and reps, then complete a set.
- Ask the AI coach for a short, time-constrained workout suggestion.
- Log a meal and interpret remaining macro progress.

SUCCESS SIGNALS

Task completion
Users finish core tasks without moderator help.

Time to action
Fewer steps between intent and workout start.

Error recovery
Users can edit or recover from logging mistakes.

Comprehension
Users understand metrics, labels and AI suggestions.

Build confidence through iteration

A practical roadmap prioritizes clarity and reliability before expanding personalization.

PHASE 1

FOUNDATION

Audit contrast, typography, spacing, navigation and metric consistency.

PHASE 2

CORE TASKS

Prototype workout start, set logging, completion and nutrition entry.

PHASE 3

PERSONALIZATION

Test AI coaching, training recommendations and recovery explanations.

PHASE 4

VALIDATION

Run moderated usability sessions, fix friction, then measure retention and repeat use.

THE FORGE PRINCIPLE

Great fitness UX does more than display data. It turns intention into a clear next step, supports action in the moment, and makes progress feel understandable.
