DIGITAL EXPERIENCE / UX CASE STUDY

LUMIÈRE

Designing a calmer, more confident journey for a premium bedroom and home-furnishings brand.

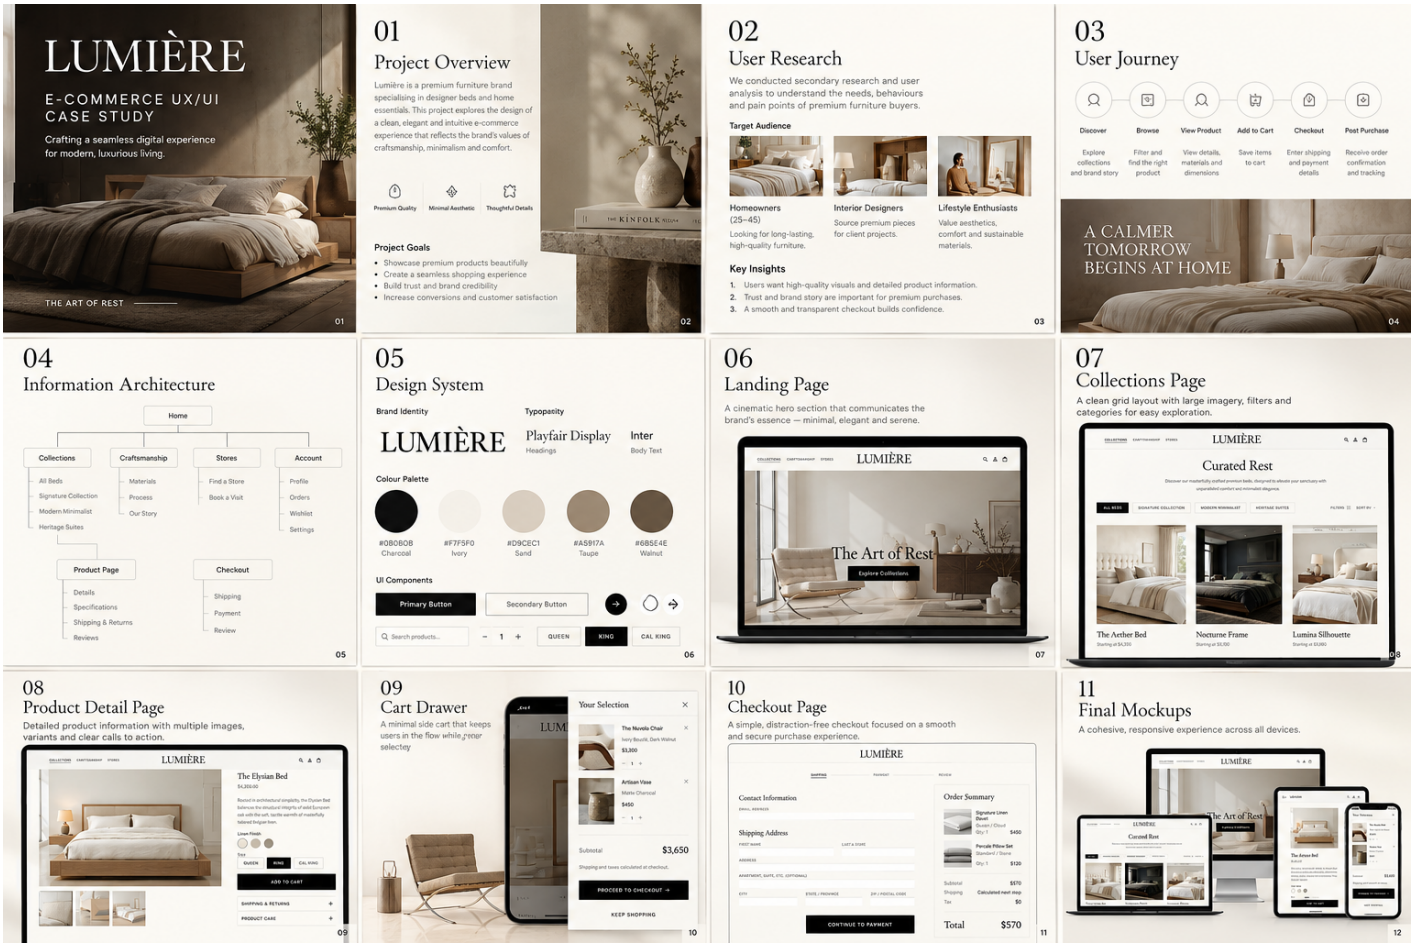

PROJECT Luxury e-commerce experience	**SCOPE** Discovery, collection browsing, product detail, cart and checkout
PLATFORM Responsive web storefront concept	**DESIGN DIRECTION** Editorial, minimal, tactile and premium

Portfolio case study • UX review based on the supplied interface screens. Business outcomes and research findings are framed as hypotheses or recommendations, not measured results.

LUMIÈRE — CREATIVE UX MOCKUP BOARD

A visual direction board translating the supplied screens into a cohesive portfolio narrative: brand, journey, design system, responsive storefront and checkout.

Conceptual portfolio visualization. Use the supplied original UI screens as the source of truth for exact interface details; generated mockup imagery is illustrative.

A luxury experience should feel effortless—not opaque.

Lumière’s storefront uses a restrained visual system to sell premium beds, furniture and soft furnishings. The supplied screens show a coherent journey: an editorial landing page, a curated collection grid, a product detail page, a cart drawer and a shipping-first checkout. The strongest opportunity is to pair the calm visual language with equally clear decision support, practical product information and transparent checkout expectations.

The core UX challenge

High-consideration furniture purchases require more than beautiful imagery. Customers need confidence about dimensions, materials, finish and size options, delivery logistics, returns, product fit and the total cost before committing. A minimal interface can communicate luxury, but if it hides key details or makes comparison difficult, users may hesitate or abandon the journey.

WHAT WORKS	WHERE TO IMPROVE
• Consistent editorial typography and neutral palette • Strong lifestyle photography • Clear product imagery and product hierarchy • Cart drawer gives a quick review without leaving the page	• Add stronger decision support for size, materials and room fit • Make shipping, delivery and returns easier to evaluate early • Improve visible form guidance and checkout reassurance • Support comparison and save-for-later behaviour

Case-study note

No analytics, customer interviews, usability recordings or business data were supplied. The observations below are a heuristic design review of the visible screens. Research plans, metrics and expected effects are proposed next steps—not claims that testing has already happened.

The product is not just a bed. It is a high-value decision.

Lumière presents itself as a premium furniture and bedding atelier. Its visual identity leans on whitespace, serif display typography, muted neutrals, craftsmanship language and interior photography. This positions the brand around considered purchases, long-term quality and serene spaces.

Experience goals

01	**Build trust** Make craftsmanship, material quality, care, delivery and after-sales information easy to find.
02	**Reduce decision friction** Help shoppers understand differences between products, sizes, finishes and room contexts.
03	**Keep the journey coherent** Carry selections and expectations consistently from collection to product, cart and checkout.
04	**Protect the premium feel** Use helpful information architecture without cluttering the calm, editorial interface.

Primary audience hypotheses

Design-conscious homeowners: want furniture that fits their room and aesthetic. **Quality-led buyers:** look for materials, construction and durability proof. **Time-poor shoppers:** need quick answers on availability, delivery and total cost. **Gift or accessory buyers:** may need a faster, lower-friction path for smaller items.

These segments are working hypotheses to validate through interviews and analytics—not confirmed customer personas.

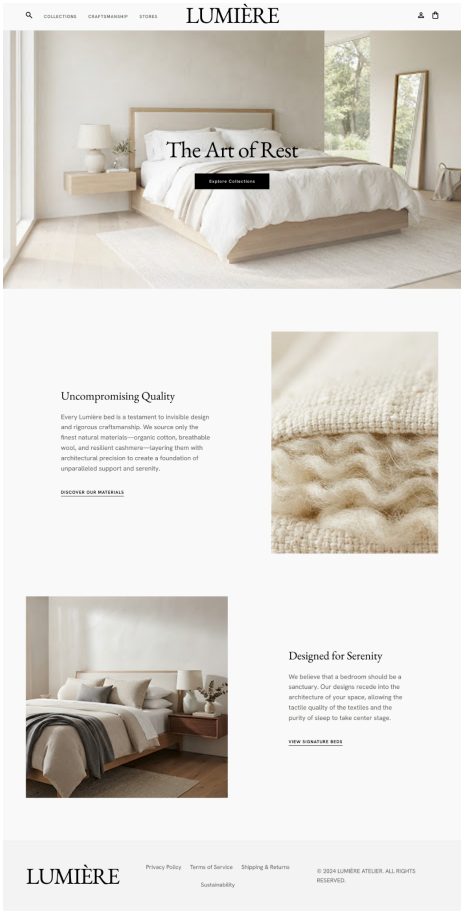

Where confidence is earned—or lost.

STAGE	USER NEED	VISIBLE DESIGN	UX OPPORTUNITY
Discover	Understand the brand and what makes it different.	Hero image, “The Art of Rest”, craftsmanship story.	Add proof points: lead times, material sourcing, warranty and service promises.
Browse	Find relevant styles and narrow options.	Collection tabs, product cards, filters and sort.	Show filter state, useful facets, compare/save controls and meaningful sorting.
Evaluate	Choose a product, size and finish with confidence.	Gallery, description, finish swatches, size buttons, accordions.	Add dimensions, room-fit guidance, delivery estimate and clear stock/lead-time status.
Review cart	Verify items, variants and total spend.	Side drawer, quantity controls, subtotal and checkout CTA.	Make edit/remove states clear; expose shipping estimate and save-for-later.
Checkout	Enter details quickly and know what happens next.	Shipping form, progress steps, order summary.	Add inline validation, autofill-friendly fields, delivery choices and a clear total before payment.

Key journey insight

The design has a strong emotional entry point. The next step is to make the rational side of a high-value purchase just as strong: fit, comparison, logistics and reassurance should be discoverable before the shopper reaches checkout.

Inspire first. Then help people find their fit.

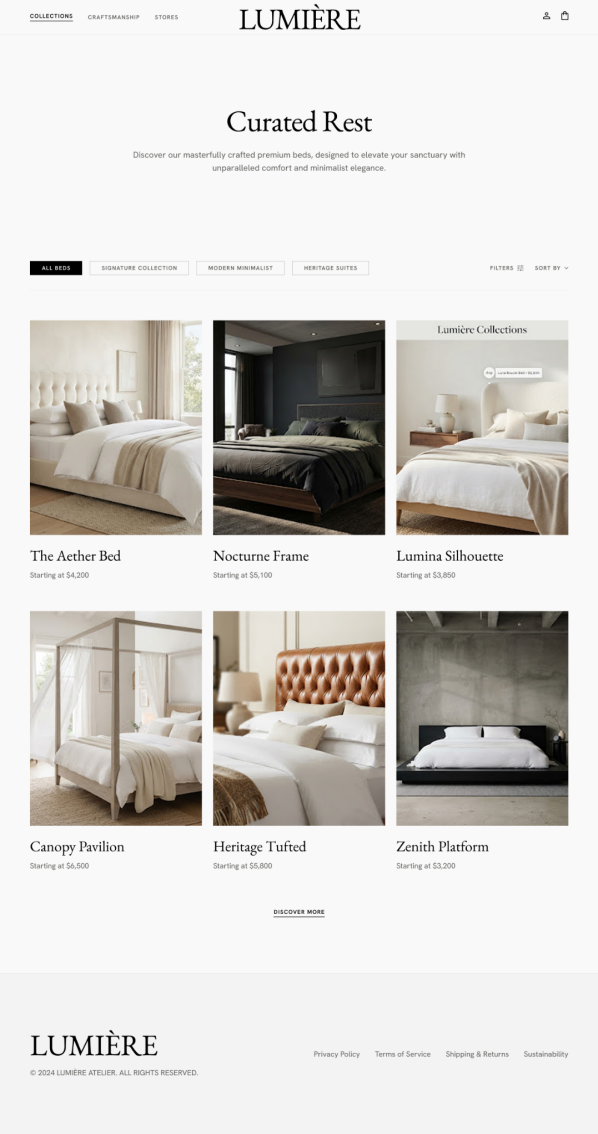

Landing page — visible strengths

The hero image and short headline quickly establish an aspirational mood. Alternating image-and-copy sections tell a material and craftsmanship story without overwhelming the page. The design feels consistent and premium.

Recommendations

• Keep the main “Explore Collections” action prominent and make its destination explicit.
• Add a compact value proposition near the hero: materials, made-to-order details, delivery or warranty—only where factually supported.
• Ensure text remains legible over imagery at mobile widths and with accessibility settings.
• Provide a visible route to customer support for large or bespoke purchases.

Collection page — visible strengths

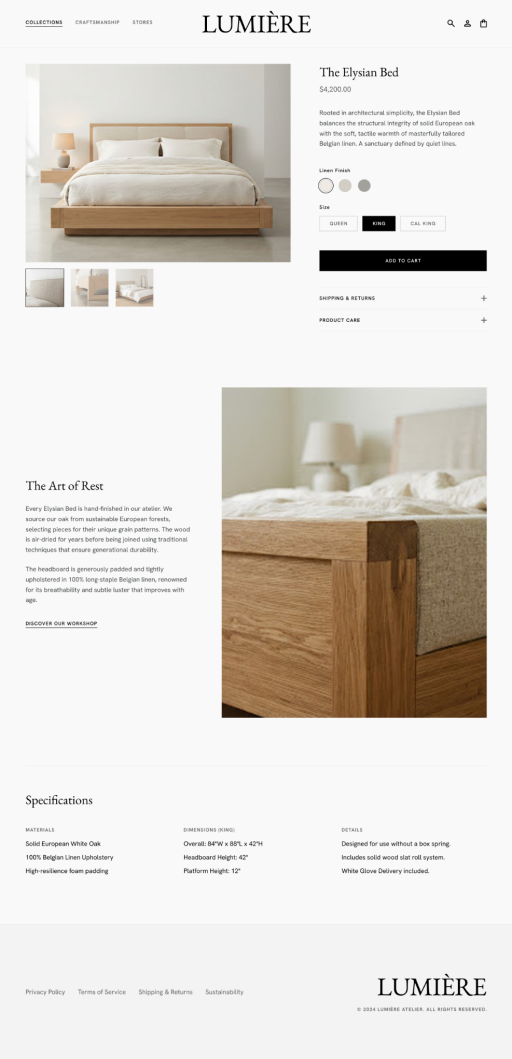

The collection page provides a useful three-column product grid, category chips, filter/sort controls and clear starting prices. Product names are easy to scan and photography communicates distinct styles.

Recommendations

- Show active filters as removable chips and provide a one-tap “Clear all”.
- Add filter counts and useful facets such as size, material, finish, availability and price range.
- Offer a compare action for shoppers deciding between similar beds.
- Clarify whether “Starting at” reflects a specific size/configuration and what changes the price.
- On small screens, use a sticky filter/sort control and ensure the grid remains easy to scan.

The product page is the confidence engine.

What the screen already supports

A large primary image, alternate thumbnails, product name, price, concise description, finish swatches, size choices and an “Add to Cart” action form a sensible evaluation path. The shipping/returns and product-care accordions give the page room to stay visually calm.

High-impact improvements

Room-fit guidance: Show exact overall dimensions and a simple room-fit diagram. Include doorway/staircase clearance guidance for bulky items.

Variant clarity: Label swatches with finish names and accessible selected states. Explain which variants affect price or lead time.

Delivery confidence: Let shoppers check postcode-based delivery availability or an estimated delivery window before adding to cart, if supported operationally.

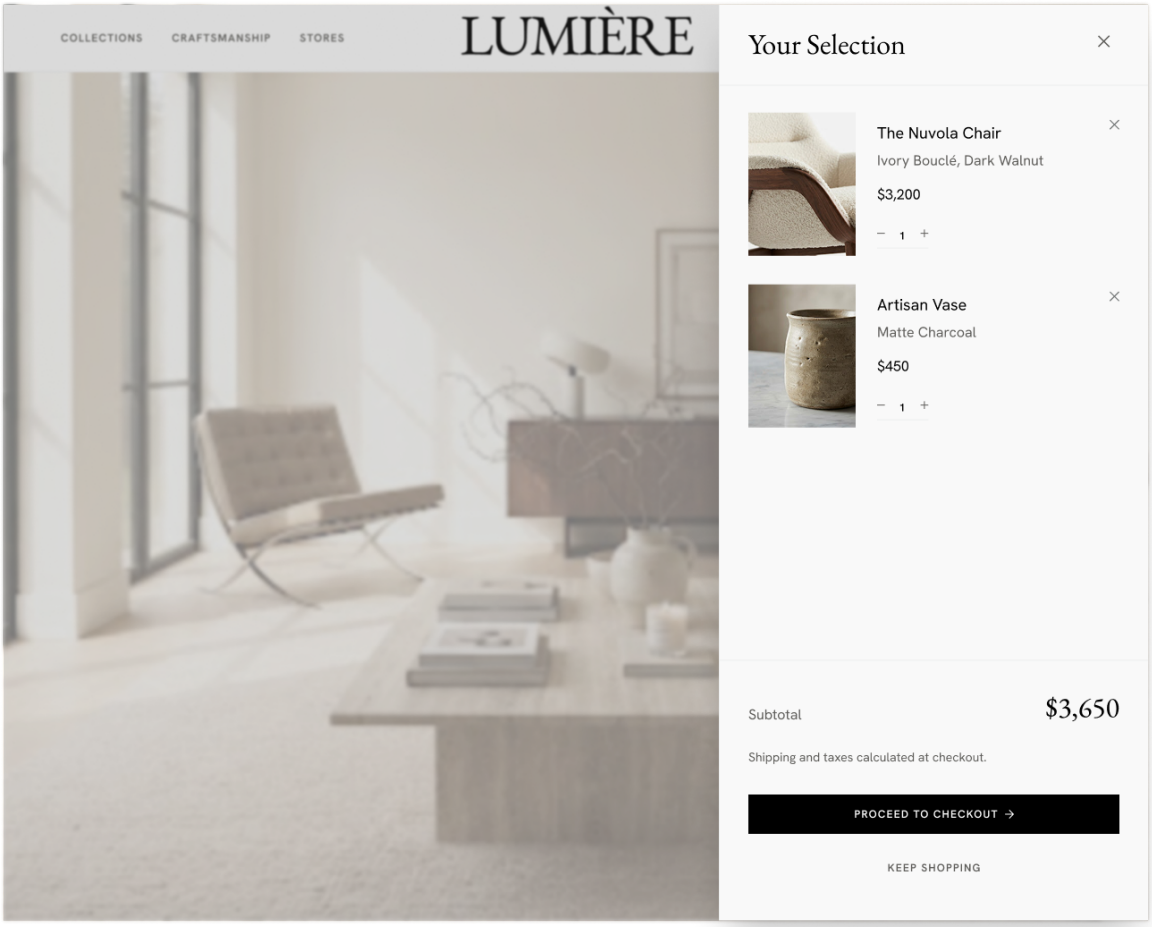

Evidence of quality: Surface verified materials, construction details, care instructions, warranty and relevant sustainability claims with evidence.

Decision support: Add a “Compare sizes” interaction and an optional consultation/help action for uncertain shoppers.

Suggested product-page hierarchy

1. Product identity and total starting price → 2. Key differentiators → 3. Variant and size selection → 4. Delivery/returns confidence → 5. Add to cart → 6. Detailed specifications, care and reviews.

A useful interruption—if it answers the right questions.

The drawer preserves context by keeping the shopper on the page. It includes product thumbnails, variants, prices, quantity controls, removal affordances, subtotal, checkout and keep-shopping actions. That is a good foundation for a low-friction review step.

Potential friction and refinements

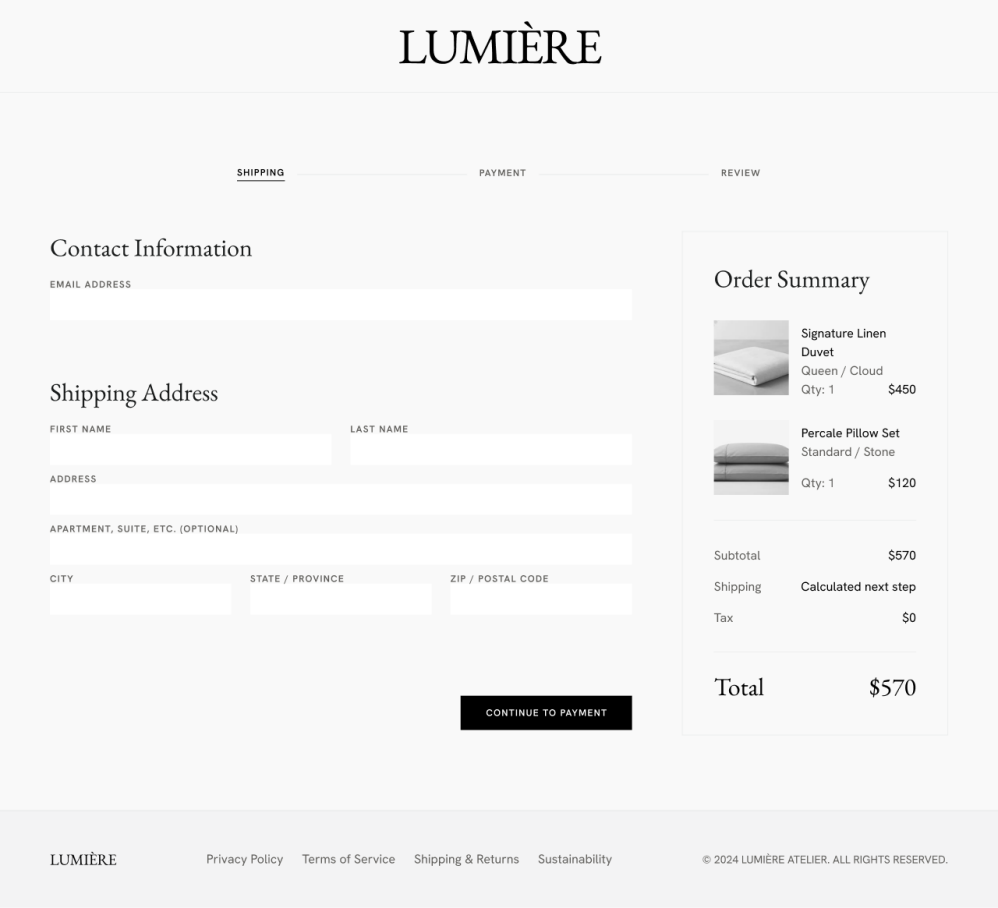

• Clarify whether subtotal includes discounts and whether taxes/shipping are excluded.
• Add an estimated shipping range or a short explanation of when delivery costs become available.
• Ensure quantity updates recalculate totals immediately and announce changes to assistive technology.
• Provide a visible confirmation when an item is removed, with an undo option where feasible.
• Make the close control, checkout button and “Keep shopping” link keyboard-accessible and clearly focusable.
• Preserve cart contents across refreshes and sessions where privacy and platform behaviour allow.

Microcopy example

Current pattern: “Shipping and taxes calculated at checkout.”
Clearer alternative: “Shipping and taxes are calculated after you enter your delivery address. Your order total will be shown before payment.”

Use the alternative only if it accurately reflects the actual checkout flow.

Make the next step obvious and the total trustworthy.

The checkout is visually calm and has a clear three-step progress indicator: Shipping, Payment and Review. Contact information is separated from shipping address fields, while the order summary remains visible beside the form. The summary itemises subtotal, shipping and tax.

Usability review

1. **Form completion:** provide persistent labels, required/optional indicators, sensible autocomplete attributes and appropriate input types.
2. **Error recovery:** validate inline, preserve entered values and explain how to fix each error in plain language.
3. **Address entry:** support address suggestions where available, apartment/unit optionality and international address formats if sold internationally.
4. **Cost transparency:** explain “Calculated next step” and update shipping/tax as soon as the address permits.
5. **Progressive disclosure:** show payment methods only at the payment step, but state accepted methods and security reassurance before users feel uncertain.
6. **Mobile layout:** keep the order summary accessible without forcing excessive back-and-forth scrolling.

Suggested checkout details

- Guest checkout by default, with account creation optional after purchase.
- Clear delivery method and delivery estimate.
- Full order total before payment confirmation.
- Edit links for shipping and cart items from the review step.

- A concise privacy statement beside email collection.
- A confirmation page with order number, delivery expectations and support route.

Keep the interface quiet; make the system predictable.

The current visual system has a clear identity: editorial serif headlines, restrained sans-serif utility labels, neutral backgrounds, thin separators, monochrome buttons and photography-led storytelling. Consistency is a strength, but a premium minimalist interface still needs visible interaction states and accessible contrast.

Proposed core components

COMPONENT	BEHAVIOUR / SPECIFICATION
Navigation	Consistent links, current-page state, accessible search, account and cart controls; responsive mobile menu.
Product card	Image, name, price qualifier, available finishes, quick view or save action; whole card not the only target.
Variant selector	Named swatches, visible selected state, keyboard operation, non-colour cue and price/availability updates.
Accordion	Clear heading, expanded/collapsed state, keyboard support; do not hide critical delivery information exclusively inside it.
Form field	Persistent label, help text, error state, required/optional status, autofill and clear focus ring.
Cart line item	Variant summary, quantity stepper, remove/undo, price and accessible update announcement.
Primary button	Consistent black fill, clear verb-led label, hover/focus/disabled/loading states and adequate target size.

Accessibility checklist

Target WCAG 2.2 AA: contrast checks for small grey text, visible keyboard focus, logical heading order, meaningful image alt text, semantic labels, keyboard-operable controls, reduced-motion support and testing at 200% zoom. Verify actual contrast and screen-reader behaviour in the implemented product; screenshots alone cannot confirm compliance.

Turn design hypotheses into evidence.

Recommended discovery work

1. Stakeholder alignment: clarify product range, shipping model, lead times, returns, warranty, support capacity and brand promises.
2. Customer interviews (5–8 initial participants): understand how people buy high-value furniture, compare alternatives, assess fit and judge trust.
3. Analytics review: inspect collection-to-product click-through, filter use, product-page exits, add-to-cart, cart abandonment, checkout field errors and payment completion.
4. Moderated usability tests (5–7 participants): ask people to find a suitable bed, compare two options, choose a size/finish, estimate delivery and complete checkout using realistic scenarios.
5. Accessibility review: keyboard-only, screen reader, zoom/reflow and contrast testing.

Sample usability tasks

• “Find a bed that fits a room with a specified width and budget.”
• “Explain the difference between two bed models and choose one.”
• “Change the finish and size, then tell us the expected price.”
• “Find delivery and return information before adding the product to cart.”
• “Complete checkout and explain the final total before payment.”

Success criteria to establish a baseline

METRIC	WHY IT MATTERS	HOW TO MEASURE
Task success rate	Shows whether people can complete key shopping tasks.	Successful completion without moderator assistance.
Time on task	Signals friction in finding and evaluating products.	Median time for each defined task.
Variant/size errors	Measures clarity of configuration choices.	Mis-selections and corrections during testing.
Add-to-cart rate	Indicates product-page effectiveness when interpreted with traffic quality.	Adds divided by eligible product-detail sessions.
Checkout completion	Tracks progress from cart to successful order.	Completed orders divided by checkout starts.
Checkout error rate	Finds avoidable form friction.	Errors by field and step; segment by device.

Do not set numeric targets until a baseline exists. Compare results by device, new vs returning visitors and product category to avoid hiding important differences.

Fix confidence gaps before adding complexity.

PRIORITY	CHANGE	RATIONALE	EFFORT
P0 · Essential	Clear checkout labels, validation, error recovery and full pre-payment total.	Protects completion and reduces uncertainty at the final step.	Medium
P0 · Essential	Expose product dimensions, variant names and delivery/returns information clearly.	Supports informed decisions for high-value items.	Medium
P1 · High value	Active filter chips, filter counts and clear-all action.	Improves product discovery and recovery from over-filtering.	Low–medium
P1 · High value	Cart removal confirmation/undo and shipping-cost explanation.	Makes cart edits safer and reduces cost surprises.	Low
P2 · Explore	Product comparison and room-fit helper.	May help shoppers narrow high-consideration choices.	Medium–high
P2 · Explore	Save for later, wishlist and consultation booking.	Supports long consideration cycles and assisted selling.	Medium–high

Experiment ideas

- Test a concise delivery estimate near the product CTA against the current information placement.
- Test clearer “Starting at” price explanation on collection cards.
- Compare a guest-first checkout against an account-led prompt, keeping account creation optional.
- Evaluate whether a product comparison tool improves task success for shoppers choosing between similar models.

Each experiment should have one primary metric, guardrail metrics (such as returns or support contacts), a defined audience and enough traffic/time to interpret results responsibly.

Preserve the serenity. Remove the uncertainty.

Lumière already has a distinctive visual direction and a recognizable purchase journey. The next iteration should not add interface complexity for its own sake. It should make the existing journey more useful: explain product differences, answer room-fit questions, clarify delivery and returns, and ensure checkout is transparent and forgiving.

The three moves I would make first

1. Make product decisions easier. Add dimensions, variant clarity, delivery expectations and comparison support where shoppers evaluate the product.
2. Make total cost predictable. Explain shipping and tax timing, then show the complete order total before payment.
3. Validate with real people and real behaviour. Test key tasks and establish analytics baselines before claiming conversion or satisfaction gains.

Expected impact (hypothesis)

> These changes are expected to reduce uncertainty and avoidable friction, potentially improving task completion and checkout progression. The magnitude of any effect must be measured after implementation; this review does not establish that a conversion lift has occurred.

Appendix / screens reviewed

Landing Page — Brand story and homepage hierarchy

Collections — Collection browsing, categories, filters and product cards

Product Detail — Product evaluation, variants and add-to-cart

Cart Drawer — Cart review, quantity controls and checkout entry

Checkout — Shipping form and order summary

LUMIÈRE

A considered digital experience for considered purchases.

Prepared as a portfolio-ready UX case study from the five supplied interface screens. All research activities, priorities and impact statements are recommendations for validation.
